Don’t miss these exciting talks;
REGISTRATION OPENS IN MARCH!

Research Spotlight:
Wang B et al. “Controlled release of dexamethasone sodium phosphate with biodegradable nanoparticles for preventing experimental corneal neovascularization” Nanomedicine 2019. This study from FG member Qingguo Xu demonstrated that a single, subconjunctival injection of novel, PEG-coated dexamethasone sodium phosphate nanoparticles prevented suture-induced corneal neovascularization (CNV) in rats for up to 2 weeks. In contrast, control groups developed severe CNV within one week.
