Everything Old is New Again: Lactide/Glycolide Polymers Continue to Deliver

Sustained release drug products incorporating polymers of lactide and glycolide have been around for nearly six decades, yet we continue to discover new ways in which these bioabsorbable materials can be tailored to meet specific application needs. With multiple modes of synthesis, nearly unlimited composition permutations, and a plethora of post-processing options, the ways in which LG polymers (PLG) can be used to deliver nearly any type of active agent are constantly evolving. In this session, we will take a look at this versatile family of polymers and dive into how they can be applied to even the most complex APIs and indications.
