

# Digital Formulation of Ocular Implants: *In Silico* Release Predictions and Microstructure Synthesis of Drug Particle Networks

Innovation Showcase

July 9th, 2024

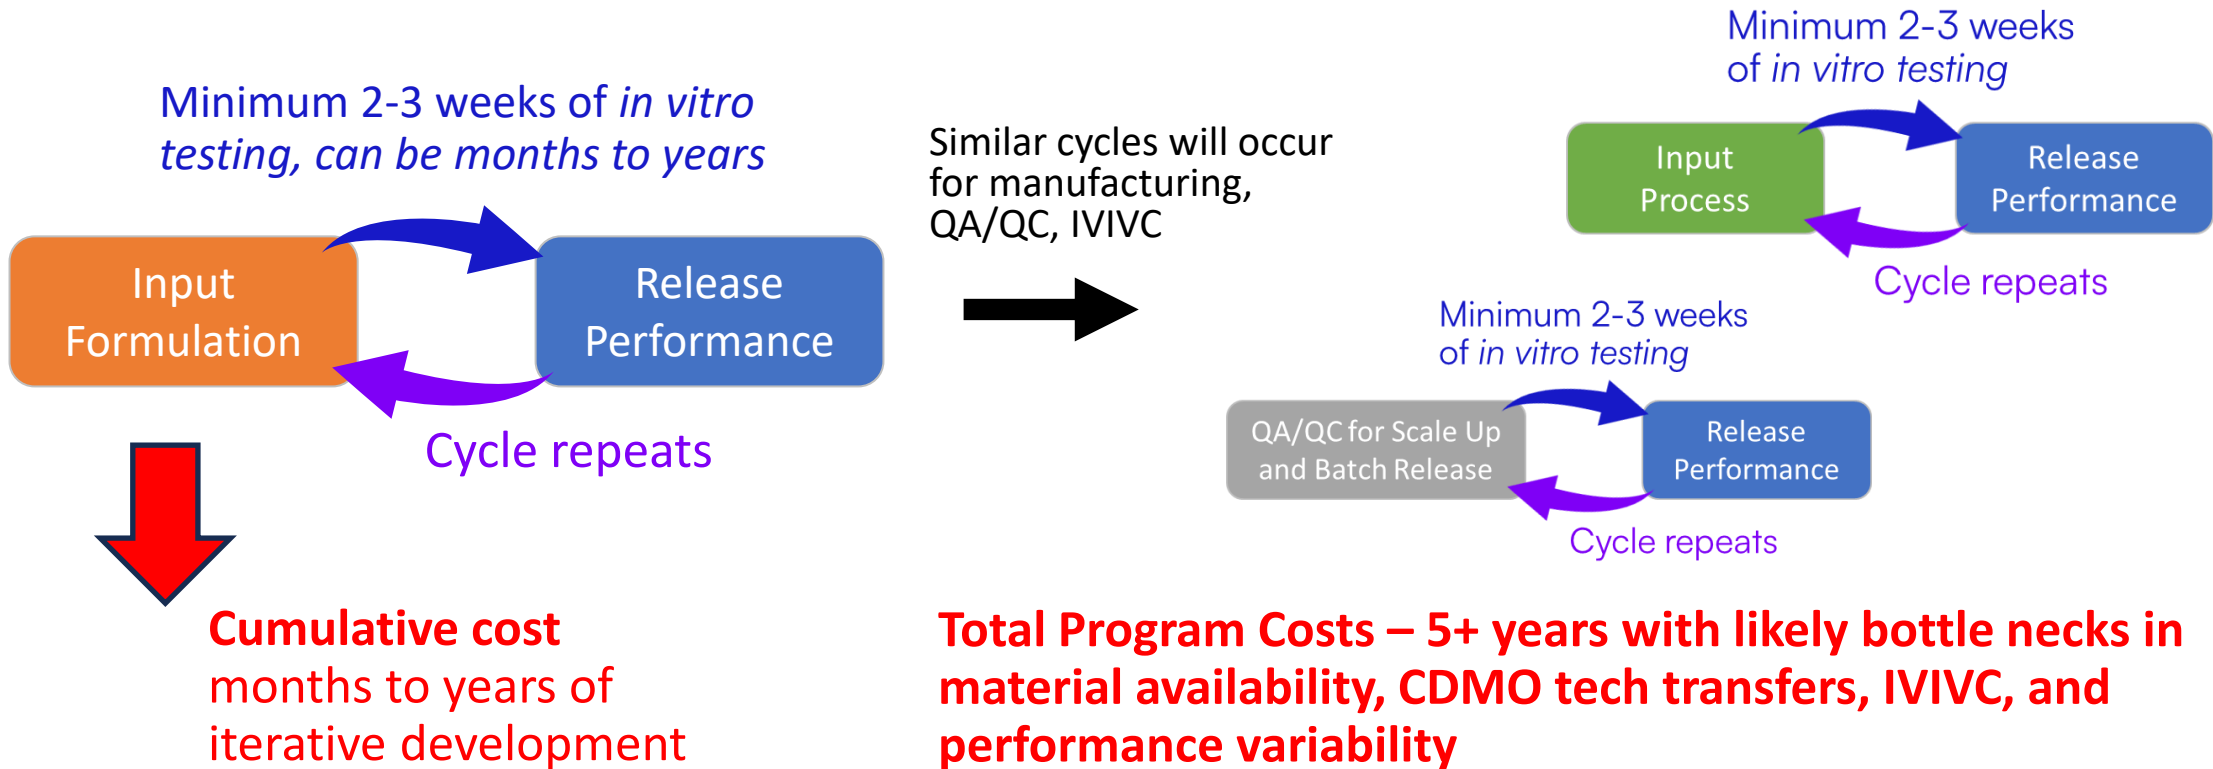

Joshua Lomeo

digiM solution

# The Challenge with Traditional Approaches to Controlled and Long-acting Development

Conventional: Guessing the product's formulation and process to performance took 5+ years of trial and error.

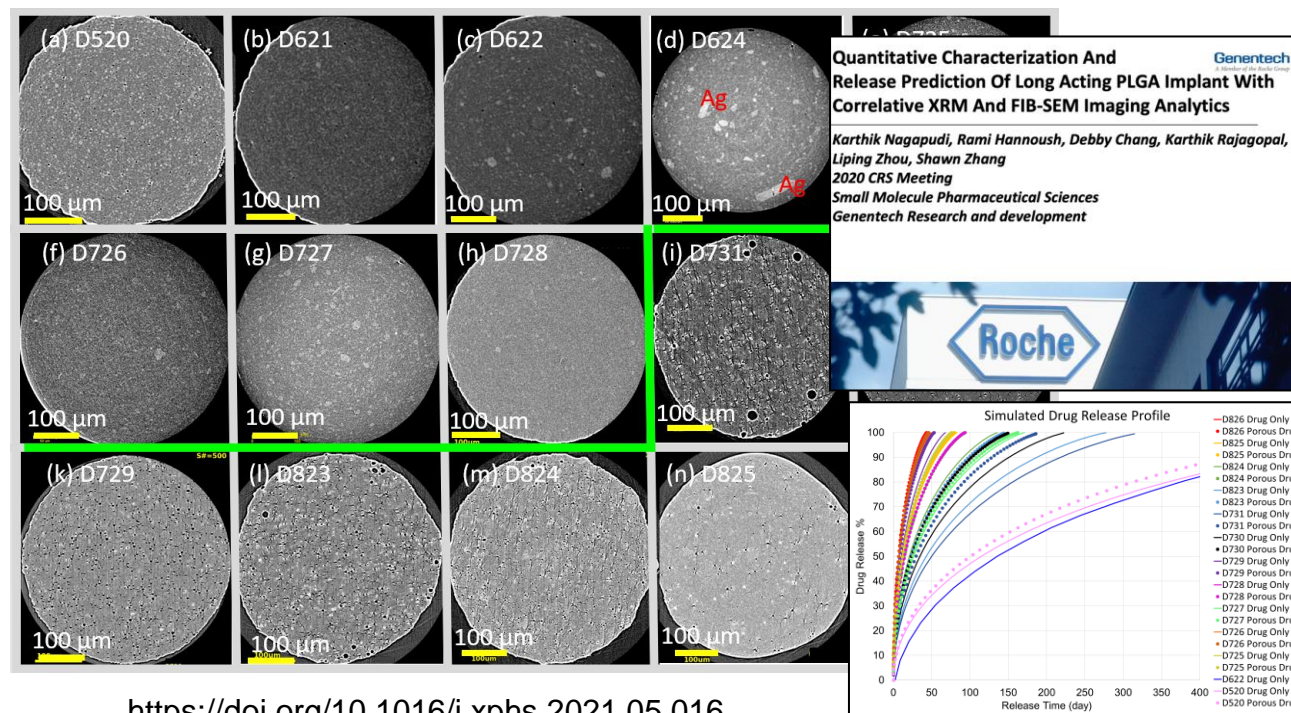

# Innovation #1 – Quantitative Analysis of Drug Particle Networks with 3D FIB-SEM and micro-CT

Workflows that supported development of MK-8591 HIV-1 inhibitor EVA implant and Genentech ocular implant

<https://doi.org/10.1007/s11095-021-03145-2>

<https://doi.org/10.1016/j.xphs.2021.05.016>

# Innovation #2 – Image-based Simulation of Release Profiles from Drug Particle Networks

Simulation performed blindfold from *in vitro* release performance

Voxel based approach integrates representativeness, computational cost, and accuracy.

External inputs for simulation:

- Bulk diffusion coefficient
- Drug load
- Drug solubility
- Implant diameter

**a. Percolation Simulation**  
Drug Release at Each Step

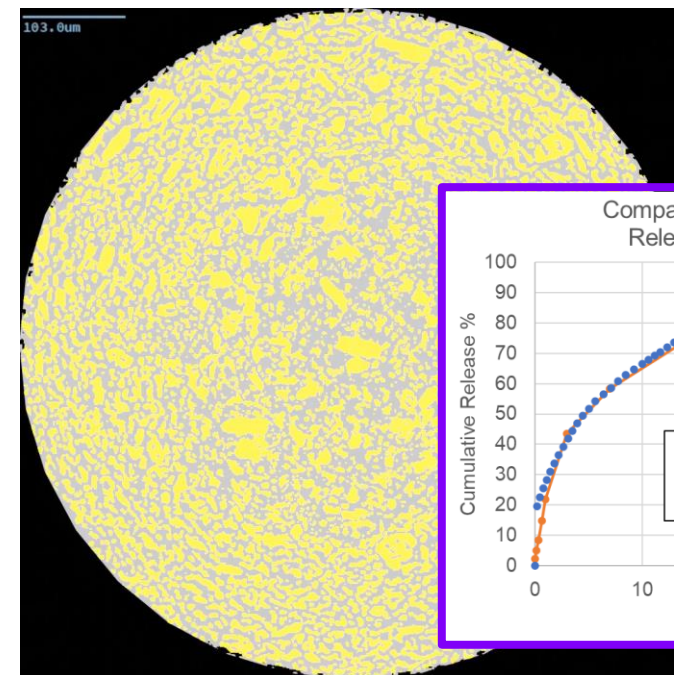

**b. Effective Diffusivity**  
Dynamic Fick's Diffusion

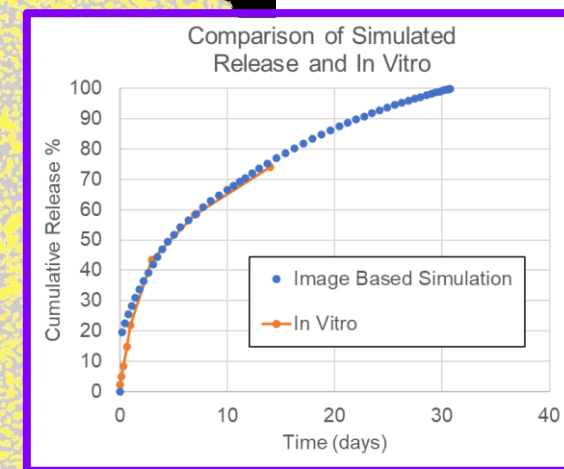

**c. Time Conversion**

Patent  
US20190108322A1

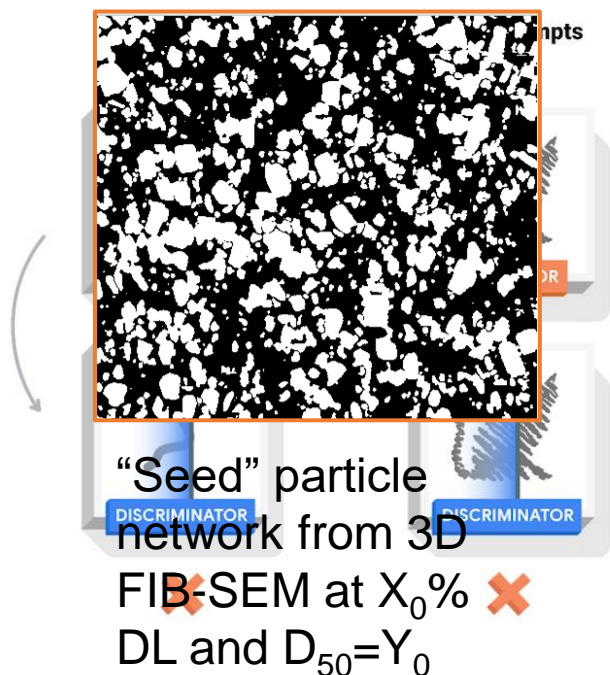

With Purdue and Eli Lilly  
<https://doi.org/10.1016/j.conrel.2023.05.049>

Erosion and  
diffusion models

# Innovation #3 – Generative Synthesis of New Microstructures for Digital Formulation

Technology Implements Controlled Changes on Microstructure While Fixing the Other Microstructure Variables

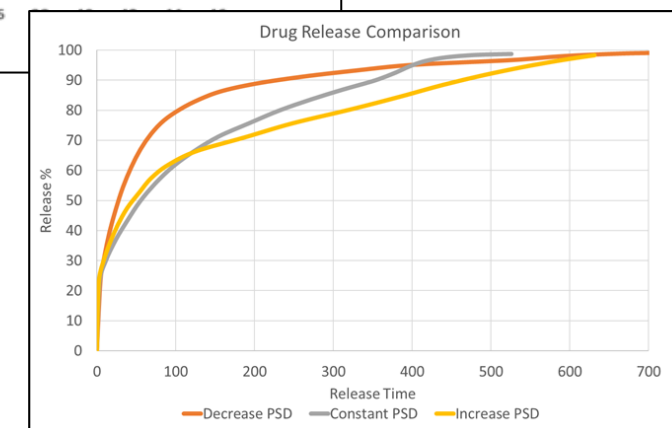

Synthesized networks with modified drug load

Fine tuning the digital formulation parameter space: Percolation threshold is found to occur at ~25%wt drug loading

Determining the optimal micronization size

Patent Pending

# Digital Formulation of Ocular Implants:

In Silico Release Predictions and Microstructure Synthesis of Drug Particle Networks

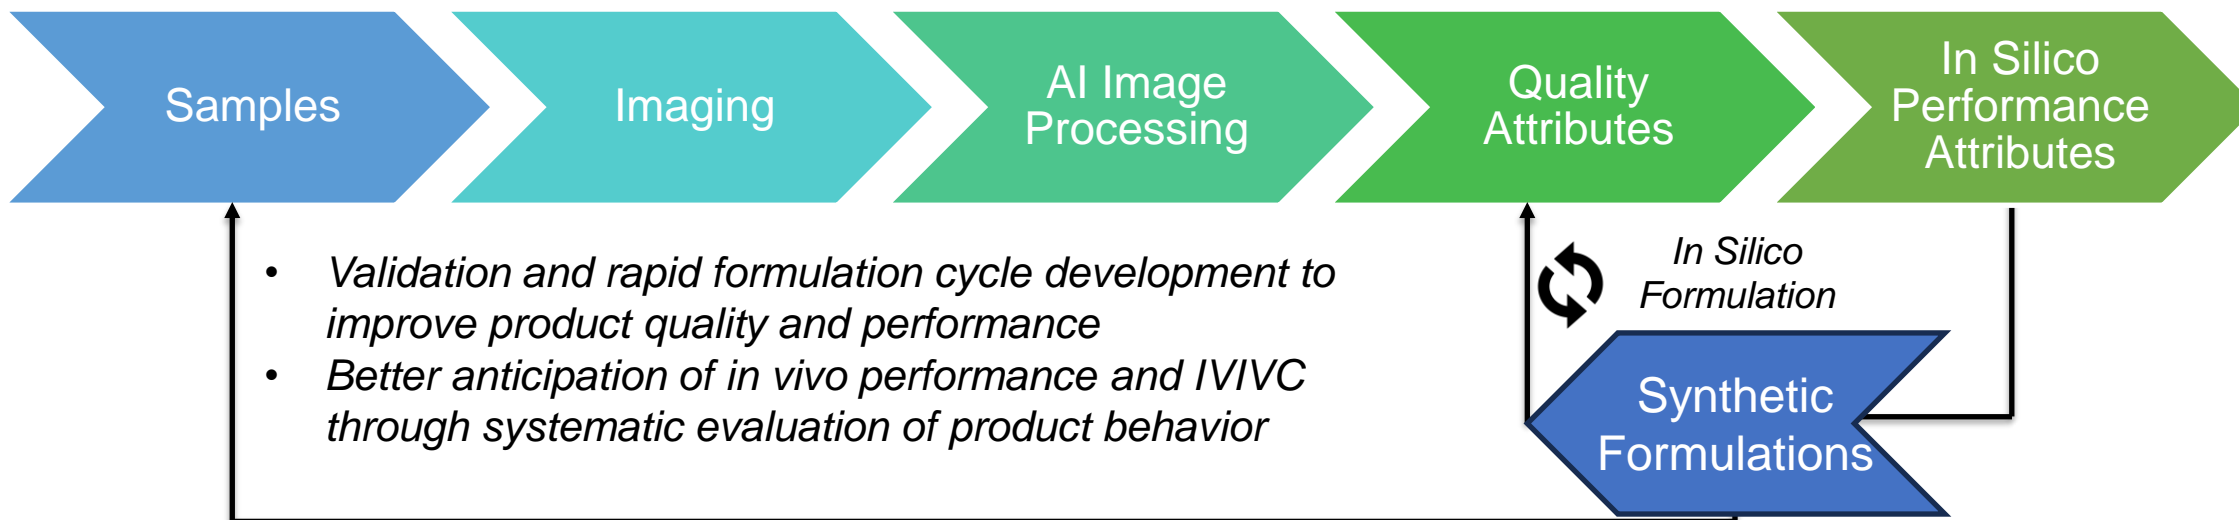

Minimum 2-3 weeks of *in vitro* testing can be months to years

Stepping away from endless and long formulation development cycles

Cycle repeats

# *Questions?*
